

## **Instructions for Use**

Mix together equal parts of each stick from the pack. Knead and roll in the hands for at least five minutes until the colours merge and become uniform and no streaks can be seen; mix for another minute. The surfaces to which the putty is applied should be free from grease and dirt. Smooth surfaces should be cleaned with a suitable solvent or with soap and warm water to remove dirt and grease. Abrading the surface will improve adhesion. The putty may now be applied and will set hard in three to four hours without shrinking.

At all stages from initial mixing to final setting Milliput responds to the use of water. To aid manipulation and avoid sticking, fingers and tools should be kept moistened with water. There are certain instances when work may be carried out in a gentle stream of water under a tap. To obtain a smooth finish, mould or apply Milliput and then immediately wipe and smooth gently with wet finger or with a fine textured moist cloth.

When tools have been used for applying or contouring Milliput they should be cleaned immediately after use with a wet rag or paper. If the putty is allowed to harden on it will be almost impossible to remove.

In the putty state (i.e. before setting) Milliput, like most chemicals in domestic use, may cause irritation to sensitive skins. When mixing the two components it is advisable to use rubber gloves or throw-away polythene gloves. When rubber gloves have been used wash them immediately after use, and whilst still on the hands, using running water. If the hands have been used for mixing or manipulating Milliput wash them immediately after use with toilet soap and warm water. Milliput should be stored in a cool place.

## **Shelf Life**

Generally Milliput has a shelf life of around two years, however many of our customers find it is workable for much longer.

We recommend that Milliput is stored in cool, dry conditions and that the polythene bags are re-sealed after use.

If you are interrupted while you are mixing Milliput, you can put the Milliput into a deep freezer until you can get back to work. This will keep the product at approximately the same state of setting at which it was frozen for up to 36 hours. Simply remove the now frozen product from the freezer and warm in the hand and it is ready to use. If stored immediately on mixing it retains its sticky nature.

## **Instructions for Superfine White Milliput:**

It is very important when using this grade of Milliput, because the sticks are virtually the same colour, that you mix the two parts for at least five minutes.
